ML Exercise, Agents in IT solutions. Week 4.

ITA ML.
In groups of 2-3.

Discuss in group. No code.
Write answers in template doc (Canvas).

Write (very shortly) your answers to 2,3 and 4 in the template, see canvas, which you send to me at the end of the exercise.
You have 7 minutes for each exercise.

Exercise 1.

What is an AI-agent? Talk this through in the group (Ask chatbot).

Exercise 2.

What is your solution about?

Design an IT Solution with AI Agents
Imagine that your group has been asked to develop a new IT solution in which one or more AI agents play an important role.
The solution can address a problem within education, business, healthcare, public services, everyday life, entertainment – or another area you find interesting.
At this stage, you are not expected to build the solution. Your task is to talk about what your team could realistically create.

What is your solution?
Discuss and describe your idea.
What problem does your IT solution solve, and who would use it?

Explain what the **AI agent or AI agents actually do** in the solution. Why is an AI agent useful here instead of simply building a traditional IT system?

Exercise 3.

What technologies would you need?
Make a simple overview of the technologies that could be part of your solution.
Consider, for example:
AI Agent → LLM → Tools/APIs → Data/Database → User/Application

Discuss which technologies you would need for (ask chatbot?).

- the AI agent and its reasoning/decision-making
- an LLM
- external tools or APIs
- databases or other data sources
- backend and frontend
- communication between the different components

You do **not** need to know exactly which technologies you would choose. The important thing is that you can explain what the different parts of the system need to do (Again, you only have 7 minutes here…so, be brief).

Exercise 4.

How far could your group realistically get?
Imagine that you had to start developing the solution today.
Discuss what your group realistically believes it could achieve after:
1 day:
What could you have working? Could you demonstrate one small part of the idea?
3 days:
What could a first prototype contain? Could an AI agent already interact with a tool, API or database?
1 week:
What would a realistic Minimum Viable Product (MVP) look like? What could you actually demonstrate to another group?
