Installation guide to having visualization of decision trees - pydotplus and graphviz:

There are two ways to do it - either through Anaconda (method 2) or outside Anaconda (method 1)

Method 1: should always work - outside of Anaconda

Install pydotplus with pip command line: pip -install pydotplus
Install Graphviz (standalone program - outside of python) :

how to install graphviz: :
https://pypi.org/project/graphviz/

Method 2:

Installing with Anaconda - should be possible, but some students say it does not work - but you should try this first I think and if you have problems switch to method 1.

1. https://anaconda.org/anaconda/pydotplus

2. https://anaconda.org/anaconda/graphviz

Important notice
If you get an error saying that it cannot find the graphviz executable, then you need to add the bin directory of the where Graphviz is install to the windows path. For my installation I have added this path to my windows path (check where yours is installed).

C:\Program Files (x86)\Graphviz2.38\bin\;

If you don't know how to add to windows path you can find many guides on the net, here is one example:
http://www.itprotoday.com/management-mobility/how-can-i-add-new-folder-my-system-path

After adding to the path, then open a command prompt and type "path" to check if it works. The procedure for a MAC computer is different - I don't know how that works so you must google this yourself.

If you still have problems you can try to install the standalone graphviz package from here:
https://graphviz.gitlab.io/download/
